

Cooking food in vigorously
bubbling liquid (212°F / 100°C).

Cooking with dry heat in an oven, typically for breads and desserts.

Cooking over an open flame or
hot grate, adding charred
flavor.

Removing outer skin from
fruits or vegetables.

Shredding food using a
grater.

Cooking food quickly in a small amount of fat over high heat.

Cooking gently in liquid just
below boiling.

Melting fat out of meat by
slow heating.

Letting dough rest and rise
before baking.

Cooking food with hot vapor
instead of water.

Cutting food into uniform
cubes.

Spoon or brush liquid over food
as it cooks to keep it moist.

Forcing oil and water to
combine into a stable mixture.

Briefly boiling food, then
shocking it in ice water.

Cooking food slowly while
submerged in fat.

Slowly raising the temperature
of ingredients to prevent
curdling.

Fully submerging food in hot oil
until crisp and cooked through.

Adding liquid to a hot pan to
dissolve browned bits.

Cutting food into thin,
matchstick-like strips.

Cooking vacuum-sealed food in
a precisely heated water bath.

Adding a small decorative
topping.

Cooking vegetables gently to
release moisture without
browning.

Removing the outer peel of
citrus for flavor.

Cooking with intense direct
heat from above.

Slowly cooking meat first, then
searing at the end for crust.

Thickening liquid by
simmering off water.

Pre-baking a crust before
adding filling.

Soaking food in saltwater for
moisture retention.

Fermenting with salt to
encourage beneficial bacteria.

Resting flour and water before kneading to improve gluten formation.

Folding fat into dough in layers (croissants).

Using science to change
food's texture and form.
